

# IBM MQ 9.4

## What's new

9.4 Announce: 14 May 2024

GA: 18 June 2024, 5 July 2024 (z/OS)

9.4.1 Announce: 08 Oct 2024

GA: 24 Oct 2024 (most), 8 Nov 2024 (z/OS)

# IBM MQ 9.4 LTS

V9.4 LTS available 18 June 2024  
z/OS and the MQ Appliance in July

In 2016 MQ introduced a dual Long-Term Support and a Continuous Delivery model.

## Continuous Delivery

New CD versions of MQ are released approximately every four months, incrementally introducing new product capabilities.

Intended for those who can continually integrate.

## Long-Term Support

Approximately every two years a new LTS version is released, rolling up many of the CD capabilities into a release with longer-term support.

Required by those looking for fixed function.

## Mix and Match

Both are available under the same license.

Both can interoperate, just like any previous version of MQ.

All the function delivered in the 9.3.x CD releases is available in the long-term support release **V9.4 LTS**

# IBM MQ 9.4 LTS

## Enhanced Observability

Identify potential issues with simple, real-time analysis of queue managers, applications, and MQ networks.

Updated MQ Console aids in identifying and resolving issues.

## Improved Admin & Developer Experience

MQ 9.4 has many updates or enhancements to provide a simplified Administration experience and a better developer experience.

## Cloud-Native Security

Authenticate with tokens, improving security and centralizing identity management for queue managers.

## Cloud-Native Resiliency

Fast and efficient data compression for Native HA data replication reduces network load – increase traffic without increased infrastructure costs!

## Insight into Business Events

Tap into MQ data and deliver it seamlessly into Kafka through IBM-supported sink and source connectors to become an event-driven business.

## Performance & Scalability

Reduce the risk of applications becoming slow, unresponsive, or crashing through LZ4 compression and Uniform Clusters.

## Managed File Transfer Enhancements

Use the updated Managed File Transfer (MFT) in MQ Advanced for gaining diagnostics related to file transfer and to understand & troubleshoot performance of MFT agents.

## Amazon Web Services Deployments

Purchase via AWS Cloud Marketplace, Tooling and Cloud native learning path, and a partner solution for rapid deployment of a reference architecture.

# New in IBM MQ 9.4 LTS

.NET 6 libraries	CAPEXPY	RDQM on RHEL 9	MQIPT MQCSP password protection	64-bit Channel Initiator	SMF queue statistic enhancement	Streaming queues for shared queues	Console observability	Instana transaction tracing with CP4I in OCP	ANY* generic CipherSpecs for AMQP
Enhanced DISQMSTATUS	TLS 1.3 for managed .NET clients	MQ Console application view	Java modular application support	Simplified REST Messaging API security	Native HA entitlement with MQ Advanced	SMF116 STREAMEDN for streaming queues	Appliance DR between two HA pairs	Developer Essentials badge for AWS	Restricted MQ Operator permissions
MQ Console, object and application association linkage	AMQP performance enhancement	Remote REST messaging	JSON web tokens, initial support	Native HA auto recovery of damaged objects	Comprehensive per-queue SMF stats	Appliance CLI SSH certificate authentication	Appliance disk space monitoring	Arm Developer container for MacOS	Configurable LogFilePages with MQ Operator
Smarter recovery log media image scheduling	MQ Console overview landing page	Tuning options for log I/O warnings	Supported Kafka Connectors with MQ Advanced	Enhanced Appliance support for SSH signatures	Smarter JMS Uniform Cluster auto balancing	Exactly-once Kafka Connectors	Simplified Java and JMS topologies for z/OS	Automated installs with Ansible Galaxy	Message property support for CSQ1LOGP
Stand-alone IBM MQ Web Server install	Open Telemetry tracing	Expanded JWT support for JMS applications	MQ Console application and network observability tabs	Updated compiler support for AIX C applications	Simpler zHyperWrite enablement on z/OS	Appliance secure backup and restore	AMQP samples	Developer tutorials for Uniform Clusters	MacOS client toolkit in Homebrew
JWKS for token authentication	Updated cipher support with Managed File Transfer	Persistent Volume flexibility (containers)	LZ4 compression	TLS certification bypass option	.NET 8 support	Automate MQ fix pack version upgrades	Non-production tags for IBMi	RedHat OCP odd version support	New 5+1+3 lifecycle

z/OS

Appliance

Containers

Software

Cloud

MQ 9.4.1 is the follow-on Continuous Delivery (CD) release to MQ 9.4.0 LTS, and it includes enhancements that enable clients to accelerate cloud-native container-based deployments to increase operational agility at scale. It also brings several security enhancements across a range of MQ components to align to industry best practices and reduce risk.

## Distributed Software

IBM MQ Advanced

### Rapidly deploy production-ready IBM MQ Advanced in containers

Clients can now utilize the pre-built MQ Advanced container image, for rapid deployment into container runtimes managed by Containerd, cri-o, Podman, or Docker.

### Enhanced security for SFTP

MFT clients may leverage OpenSSH private keys for SFTP servers, bolstering security.

## Distributed Software

IBM MQ Advanced & IBM MQ

### IBM MQ on Azure Marketplace

Azure businesses can buy IBM MQ licenses using their cloud credits or credit cards from the Azure marketplace.

### Improved certificate management for seamless connectivity

Administrators can configure alerts when TLS certificates are near expiry thereby reducing the risk of unplanned downtime.

### Set non-production licenses in Container

Administrators can select the appropriate licenses for non-production workloads in the MQ Container.

## And these additional features that are available to all form factors including MQ for z/OS:

(IBM MQ & MQ Advanced)

### Securely retrieve connection configuration

Applications can access CCDTs (client channel definition table) via HTTPS URLs secured by TLS.

### Easier message handling

Administrators can view message headers in the MQ Console, speeding message handling decision-making.

### Enhanced MQ Console user interface

Experience an enhanced Carbon 11 based MQ Console for better observability & efficiency.

# IBM MQ support lifecycle

New 5+1+3 support lifecycle for MQ 9.4 LTS, based on IBM's Support Cycle-5 policy for MQ on Multiplatforms

- 5 years of standard support
- plus 1 year of extended code fix support
- plus 3 years of extended usage support

IBM Software Support Lifecycle Policies

<https://www.ibm.com/support/pages/node/718165>

# IBM MQ maintenance

Effective January 2023 for all in-support releases.

Two types of maintenance for distributed platforms:

- **Fix packs**  
Cumulative updates for Long Term Support (LTS) releases, as per previous practice.
- **Cumulative security updates (CSUs)**  
Smaller updates that provide security fixes and which are released monthly (when required).

This model also applies to the JMS, MFT and web UI features on z/OS, but the model for other z/OS maintenance remains unchanged.

See <https://ibm.biz/GetMQFix> to help with automation

## How do I obtain and install CSUs?

CSUs are provided as per fix packs and they are installed in the same way.

## How do I identify fix packs and CSUs?

The V.R.M.F is updated for both. Fix packs are identified by an F-digit that is a multiple of 5 (5, 10, 15, ...), and CSUs use the other F-digit values (1, 2, 3, 4, 6, 7, ...).

## Are updates cumulative?

Yes. Each CSU is built on the latest fix pack that precedes it.

## What releases are CSUs produced for?

All LTS releases (including those in extended support), plus the latest CD release.

<https://www.ibm.com/support/pages/changes-ibm-mqs-maintenance-delivery-model>

# IBM MQ 9.4 deprecations & removals

- The MQ REST API v1 is deprecated – the replacement is the MQ REST API v2.
- The Salesforce bridge has been removed.
- The IBM MQ classes for .NET Standard library was deprecated in 9.3.1 – it has been removed in 9.4.
  - The IBM MQ classes for .NET and the IBM MQ classes for .NET Framework libraries are still provided.
- For the IBM MQ .NET and IBM MQ XMS for .NET classes, the methods `WriteObject()`, `ReadObject()`, `CreateObjectMessage()` and classes `ObjectMessage` and `XmsObjectMessageImpl` used for serialization and deserialization of data are deprecated.
- MQ 9.4 LTS is the last MQ release to support Secure Sockets Layer v3 (SSLv3) and Transport Layer Security (TLS) 1.0
- MQ 9.4 LTS is the last MQ release to support Advanced Message Security (AMS) encryption with RC2, Data Encryption Standard (DES), or Triple Data Encryption (3DES) ciphers and AMS Signing with 3DES, Message-digest algorithm (MD5), or Secure Hash Algorithm 1 (SHA1) ciphers, across all MQ form factors.

# IBM MQ 9.4.1 deprecations

- TLS RSA Key Exchange CipherSpecs are deprecated in MQ 9.4.1. Any CipherSpec beginning TLS\_RSA\_WITH\_ will be [disabled by default, but can be re-enabled](#) if required. Clients are recommended to migrate to CipherSpecs that use Elliptic-Curve Diffie-Hellman for key exchange. These CipherSpecs begin with ECDHE\_RSA\_.
- The service used to start MQIPT automatically at system startup on Linux is deprecated in MQ 9.4.1. The service on Linux uses System V init, which is not supported on some recent versions of Linux. An alternative, such as systemd, can be used to start MQIPT automatically.

Observability

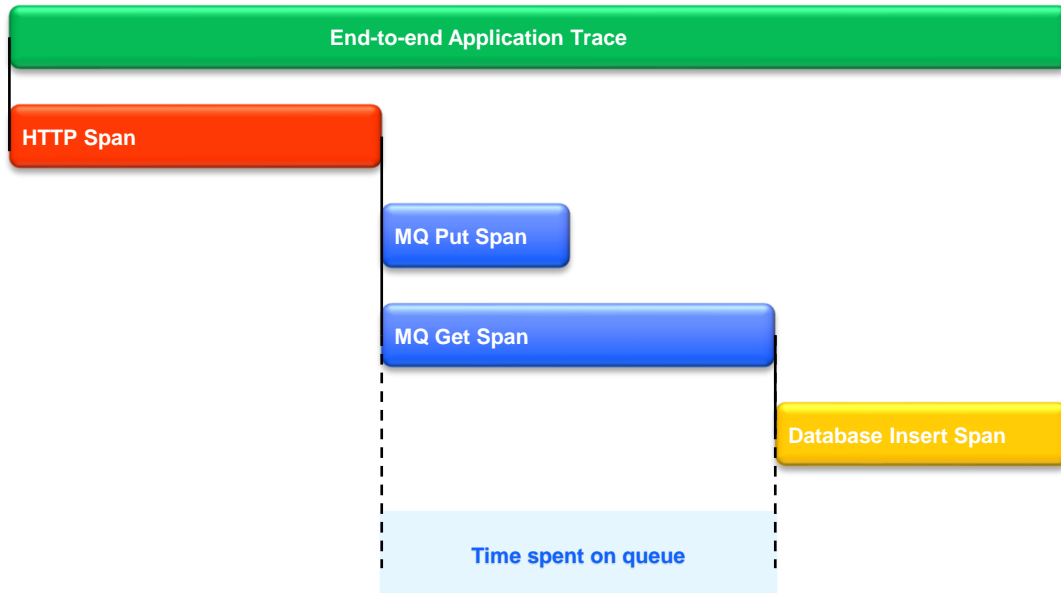

# OpenTelemetry Tracing

Available for Unix-based (AIX and Linux p/x/z) and Windows

## What is OpenTelemetry ?

- An observability framework and toolkit designed to create and manage [trace](#), metrics, and log data.
- It is **vendor and tool agnostic** - it can be used with a broad variety of observability solutions:
  - Commercial offerings such as **IBM Instana**
  - Open-source tools like Jaeger and Prometheus

Diagnose problems across multiple systems fast, using data to pinpoint where issues are

Gain insights to optimise performance end-to-end, ultimately improving customer experience

Futureproof – open and likely to become a cross-industry de facto standard for observability

### What you need to know:

- Available for Windows and Unix-based platforms (AIX, Linux p/x/z) in VMs and containers. Not available on IBM MQ Appliance.
- Instana Exit shipped with IBM MQ as a [supporting program](#)

# MQ Console dashboards (1/2)

The IBM MQ Console enables administrators to perform common tasks via a graphical user interface.

The new **Overview** tab of the queue manager page **eliminates manual look-up** so administrators can immediately understand the overall state of the queue manager and act on any emerging issues before they become problems.

The screenshot shows the IBM MQ Console interface for Queue Manager QM1. The 'Overview' tab is selected, displaying a dashboard with several key metrics and sections:

- CPU:** 0.00%
- Connected queue managers:** 3 (8 running channels, 0 problem channels)
- Connected applications:** 2 (2 running channels, 4 MQ connections)
- Messages in the last minute:** 874 (362.94 KB in, 311.41 KB out)
- Most recently used:** Lists channels like 'Test' and 'QM3' with their connection times.
- Most recently connected:** Lists channels like 'JavaConnectTest' and 'QM2' with their connection times.
- Oldest messages:** Lists messages like 'Test1' and 'Test12' with their ages.

Callout boxes provide additional context:

- Top Left:** See if the Queue Manager is under pressure (CPU, Memory, Storage). These will map to different metrics on each form factor.
- Top Right:** Gain confidence that everything is fine, by seeing the number of messages passing through the Queue Manager.
- Middle Right:** See the number of connected applications, channel instances and MQ connections.
- Center:** If the queue manager is part of a "MQ Network", show the connected Queue Managers.
- Bottom Left:** See if any queues are becoming full – and need action.
- Bottom Right:** See activity within the MQ Network from this Queue Manager's viewpoint.

# MQ Console dashboards (2/2)

The new Applications and MQ network tabs in the queue manager pages give a quick view of connected applications and connections within the MQ network.

- ✓ Easier for admins and developers to perform real-time analysis of:
  - Application connectivity
  - Queue manager-to-queue manager networking
- ✓ Reduce the time to resolution of issues
- ✓ Allow less skilled users to carry out analysis

The image displays two screenshots of the IBM MQ Console interface, showing the 'MQ network' and 'Applications' tabs.

**MQ network tab (top screenshot):**

- Queue manager: remote-MQ10 (D25JAN24, z/OS)
- Overview: Connected queue managers, Queue manager channels, Queue manager channel instances
- Running queue manager channel instances: 0
- Connected queue managers: 0
- Cluster membership: clus662, 983
- Last Updated: a few seconds ago

**Applications tab (bottom screenshot):**

- Queue manager: remote-MQ10 (D25JAN24, z/OS)
- Overview: Connections, App channels, App channel instances
- Connected applications: 8 (8 connections)
- Running application channel instances: 3 (1 user-defined channel, 1 inactive channel)
- Connections: 8 (0 local, 8 remote)
- Most common applications: MQ Console 9.3.5.0 (Connections: 6), MQ Explorer 9.3.4 (Connections: 2)
- Most common application channels: SYSTEM.ADMIN.SVRCONN (Instances: 3)
- Oldest transactions: No application connections with units of work
- Last Updated: 59 seconds ago

# MQ Console observability

MQ Console adds support for improving observability of applications, either local or remote

# MQ Console time zones

Timestamps that are associated with queue managers are displayed in the time zone where the queue manager is running, rather than the time zone of the IBM MQ Console.

# Insight into Business Events

# IBM MQ and Apache Kafka

Messaging is essential for building fully connected, efficient and scalable solutions - more now than ever before.

## Messaging patterns

Critical exchange of information from one system to another

Messages must get through, no questions asked. The system must be secure and distributed.

Real-time event notification for microservice scalability

Must be frictionless, scalable and lightweight. The system must be simple to exploit, invisible to the application.

Event streaming for data caching and processing

Must maintain a projection of the data for efficient repeatable processing. The system must scale for large data volumes.

←—————→  
IBM MQ

←—————→  
Apache Kafka

# Connecting to Apache Kafka

Data from core systems can flow uninterrupted without loss or duplication to Apache Kafka with new assured-delivery sink and source connectors, enabling businesses to drive seamless customer experiences and support strategic business processes.

Direct to queue

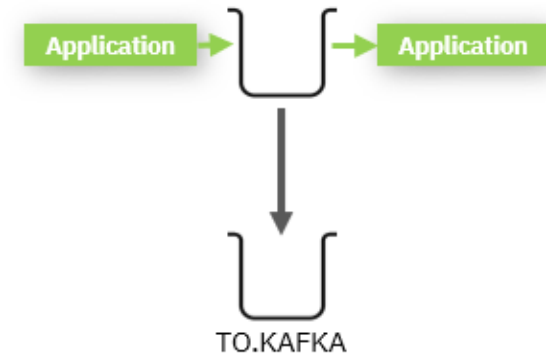

New applications, or applications that are being changed, can put messages **directly to a queue** used by the source connector.

Subscribe to topic

If messages are already being published to a **topic**, it's simple to generate another copy for a queue used by the source connector.

Streaming queue copy

Tap into your mission-critical data as it flows around the enterprise with **Streaming Queues**, without impacting the existing flow of data. Create a copy of every message onto a second queue that is used by the source connector.

# Supported Kafka Connectors

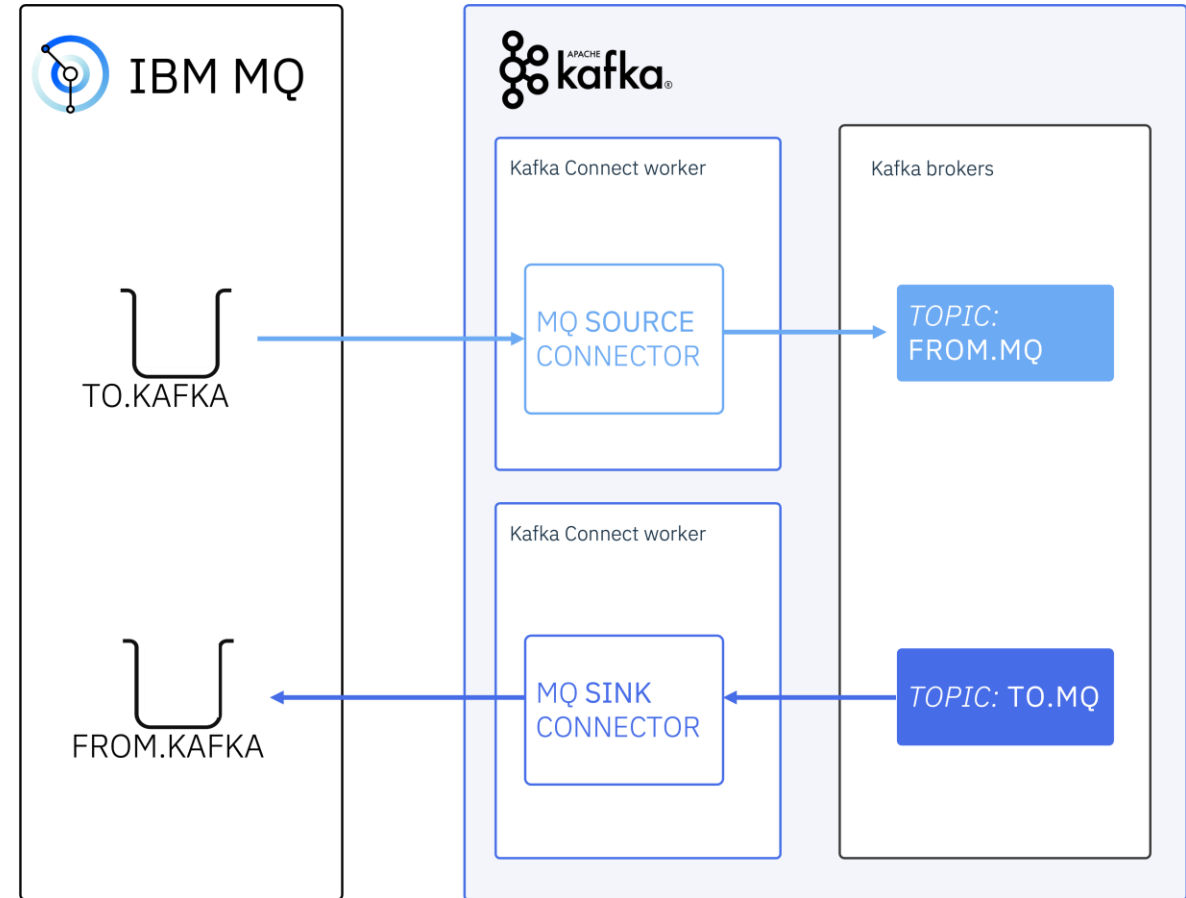

Several sink and source connectors exist for connecting MQ queues to Apache Kafka topics.

The source connector is the most used, enabling MQ to be used as a source for events into Apache Kafka.

Functionally identical connectors are available from IBM:

- Version 1: Unsupported open source
  - IBM MQ (base) and the free Developer Edition
- Version 2: Assured-delivery and fully-supported
  - IBM MQ Advanced
  - Cloud Pak for Integration

Confluent also provides a supported connector.

Version 2 of the Kafka connectors support “exactly-once” delivery of messages.

Security

# Token-based authentication

IBM MQ can use a password-less approach to authentication with JSON Web Tokens (JWT) enabling applications to operate in a secure, Multi-Factor Authentication (MFA) environment.

Secure

Token-based authentication eliminates the need for storing and transmitting passwords, which can be a security vulnerability.

Scalable

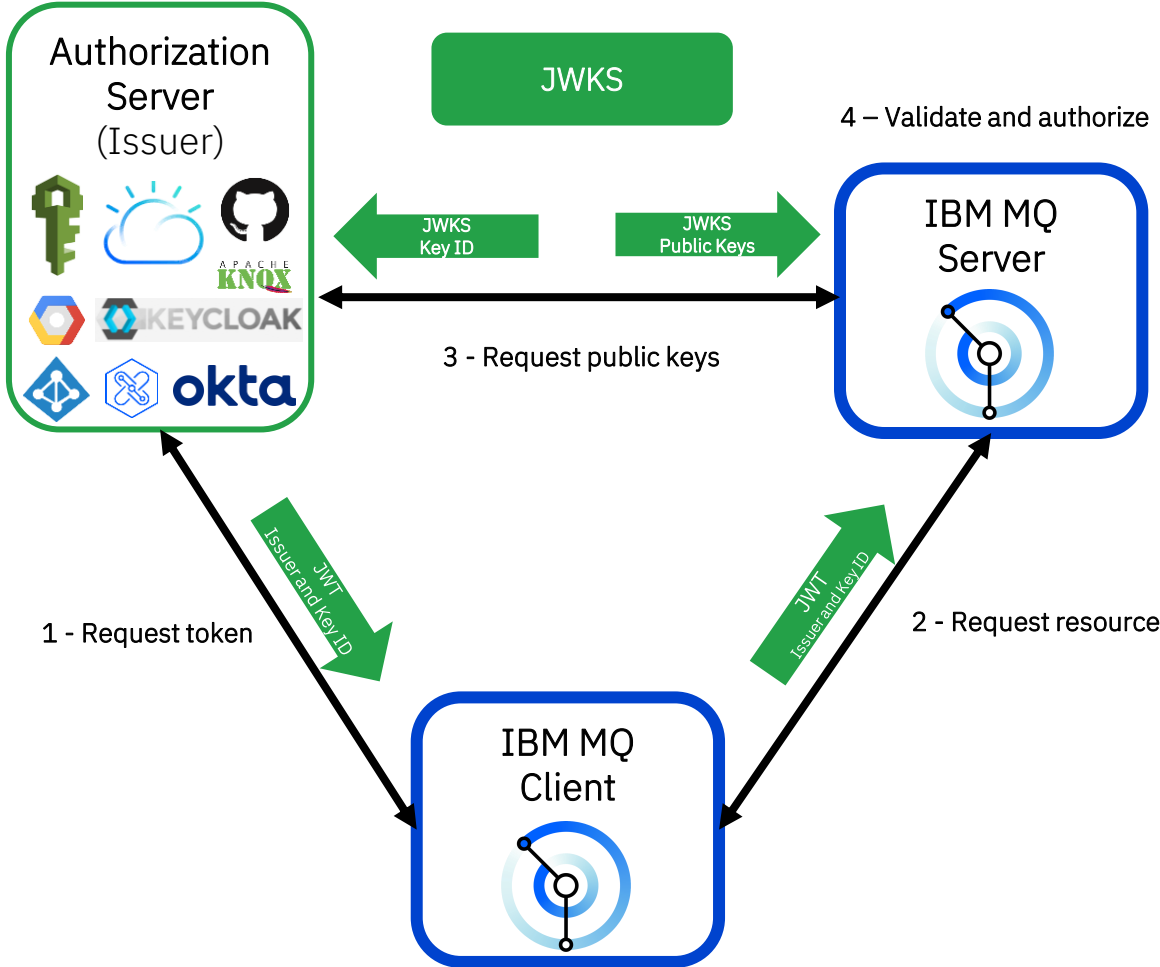

You can use one trusted JSON Web Key Sets (JWKS) issuer so your applications can authenticate with many services without separately registering with all of them.

Flexible

Tokens can be used across multiple, diverse applications or other endpoints, enabling easier secure collaboration between enterprises and platforms.

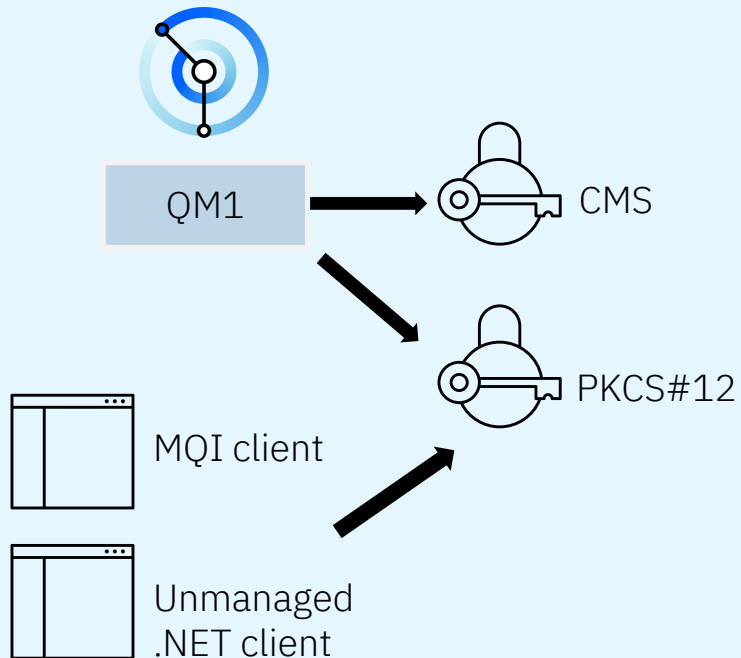

Easier

Using a JWKS issuer makes it easier to manage certificate rotation, expiry, and revocation. Keys are cached to tolerate outages and improve performance.

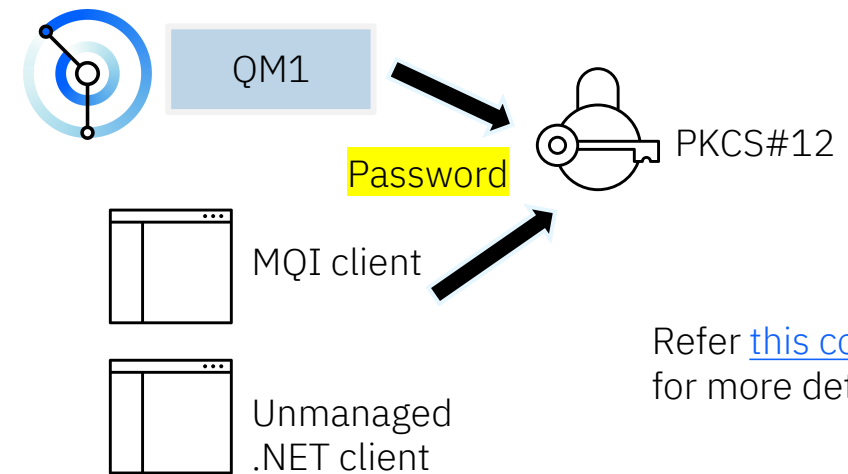

# PKCS#12 keystores

- Use a PKCS#12 keystore in place of a CMS keystore
- Use existing mechanism to point MQ at the keystore
- Change applicable for MQI, Unmanaged .NET clients
  - Java/JMS can use JRE for PKCS#12 support
  - Managed .NET uses windows certificate store

## Password support:

- Provide the keystore password directly to IBM MQ
  - ✓ Allows alternative to the stash file.
- Queue Manager command: MQSC QMGR KEYRPWD
- Clients:
  - ✓ MQSCO.KeyRepoPassword fields
  - ✓ MQKEYRPWD environment variable
  - ✓ SSL Stanza SSLKeyRepositoryPassword
- Password must be protected
  - ✓ Queue Manager does this for you
  - ✓ Encryption tools provided for client apps

Refer [this command](#) for more details.

# Other important security updates

## Read-only root filesystem

- Read-only root filesystem can be enabled for MQ running in Containers.
- This improves security by preventing writes to files inside the container at runtime.
- Not enabled by default
  - Needs to be explicitly enabled by setting, `spec.securityContext.readOnlyRootFilesystem` QueueManager API to true.
- The `readOnlyRootFilesystem` option is accompanied by additional options to configure the size of the "scratch" and "tmp" volumes that are mounted to allow writing of temporary files.

## Skip TLS certificate validation

- When SSL/TLS is enabled on MQ channels there is a significant risk of impact if TLS certificates are not renewed in time. It can also be complicated to ensure all partners have the necessary CA certificates when they change.
- MQ now provides an easy way to skip TLS certificate validation.
- Does not validate a peer TLS certificate, but still secures communications.
- Not recommended for production use, but useful as a quick start/test.

# IBM MQ | TLS Certificate Management (9.4.1)

- New command “dspmqcert” available
- Quickly see information about certificates within IBM MQ keystores
- Filter on certificates expiring within a certain timeframe
- Output in different machine-readable formats
- When run as an automated process, enables you to build alerts when certificates are near expiry.

```
$ dspmqcert -h
Usage: dspmqcert [-h] [-o <output>] [-d <days>] [-m <pattern>] [-a] [-e] [-f <path>]
Options:
  -h this help
  -o output: <json|csv|text> default text
  -d days: print certs due to expire within the days specified
  -m pattern: match queue manager names, ie. QM1, ERR*, default *
  -a include CA intermediate certificates
  -e exit error (127) if -d specified and there are certs expiring
  -f path: location of INI file mapping QM names and keystore location
```

```
$ dspmqcert -m QM1 -o json
{
  "QM1": [ {

# Resiliency & Scalability

# LZ4 compression

LZ4 is a lossless data compression algorithm that is focused on compression and decompression speed. It belongs to the LZ77 family of byte-oriented compression schemes.

From MQ 9.4, users can use LZ4 compression for network communication to:

- Reduce cost
- Improve performance

Available for communication between:

- Queue manager channels
- Native HA replicated queue managers

Choose whether to prioritize speed or compression using these values for COMPMSG when working with channels:

## **LZ4FAST**

Message data compression is performed using LZ4 encoding with speed prioritized.

## **LZ4HIGH**

Message data compression is performed using LZ4 encoding with compression prioritized.

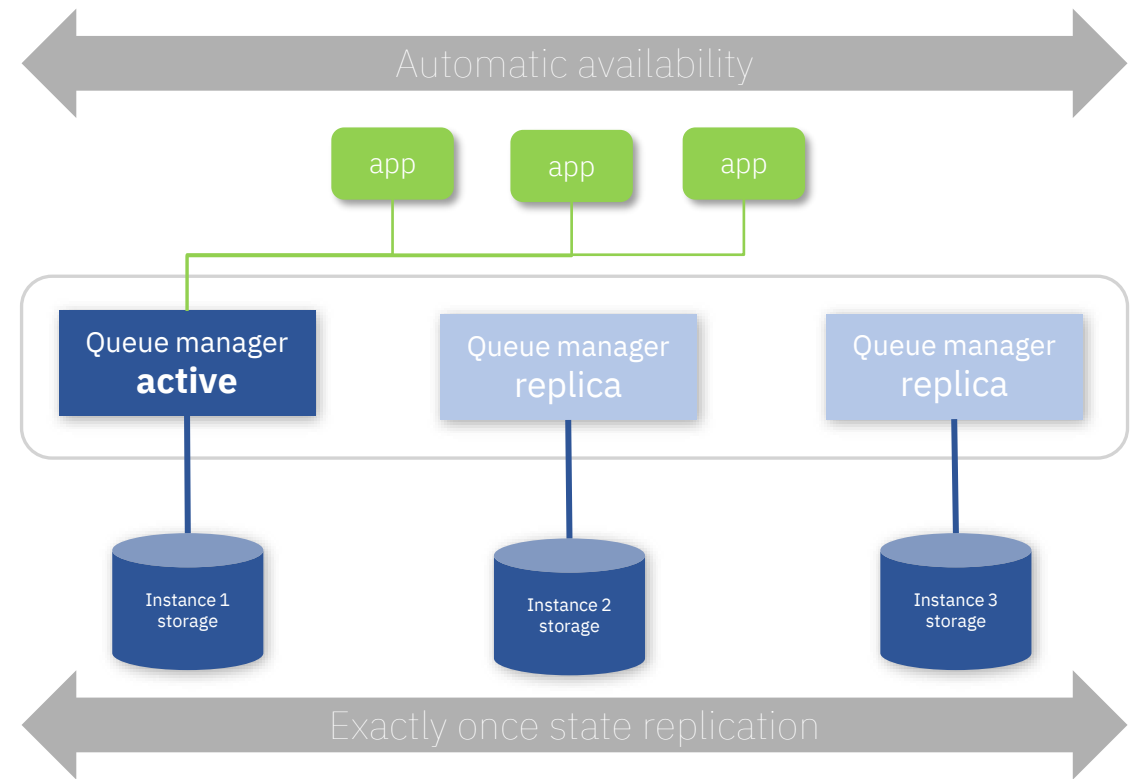

# Native High Availability (HA)

## Updates in 9.4

- Reduced network load and the associated costs through smarter media imaging.
- Automated recovery of damaged objects without the need for manual intervention.
  - Recovery is periodically retried if required, such as when object is in use
  - Damaged objects can still be recovered manually by using **rcrmqobj**
- Option to increase performance of replication with LZ4 compression.

**Entitlement:** IBM MQ Advanced & CP4I  
**Deployment:** OpenShift and Kubernetes

# Persistent volume resizing for containers

- Persistent volumes provide long-lived storage for containers – used to store MQ messages and logs
- From 9.4, MQ supports expanding persistent volumes as workloads change

## Steps to enable

- The storage class must have **.allowVolumeExpansion** field set to **true**.
- To allow expansion of a queue manager volume, **.spec.queueManager.storage.allowVolumeExpansion** field needs to be set to **true**.
- Alter **.size** fields for each of the desired queue manager volume type, for example:  
**.spec.queueManager.storage.queueManager.size: 2Gi → 5Gi**

# Administration & Application Development

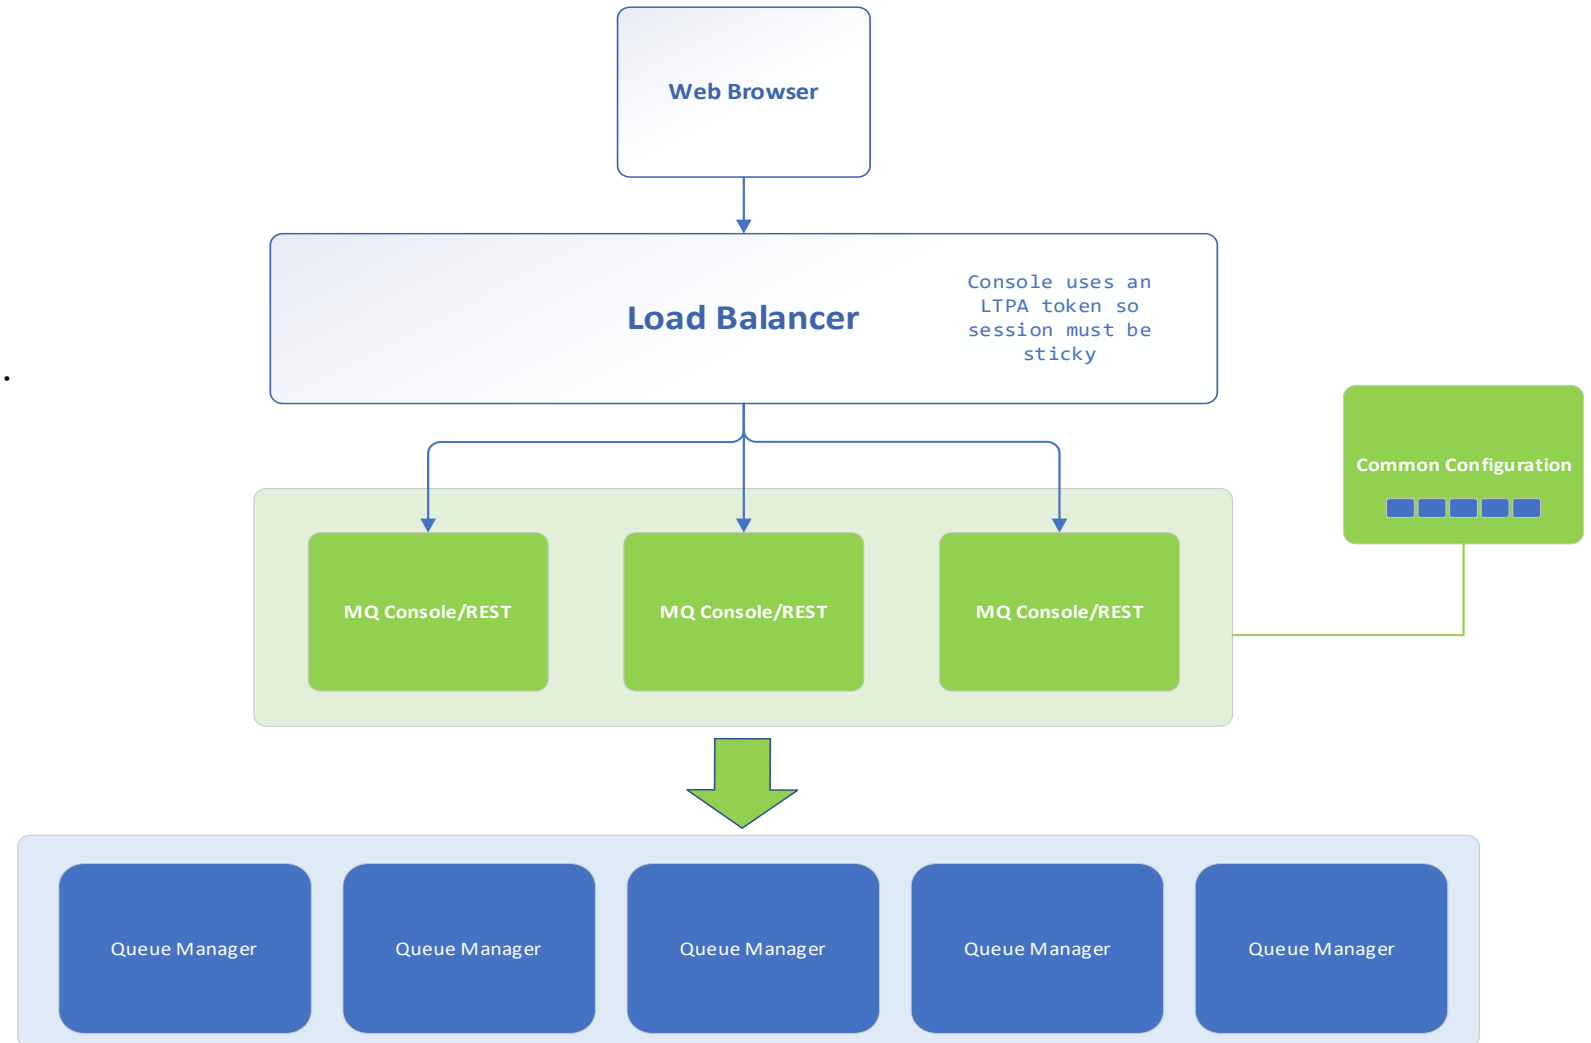

# Standalone Web Server

Decoupled, backwards compatible, scalable and highly available

Rapidly configure remote queue managers without the need for a full MQ installation.

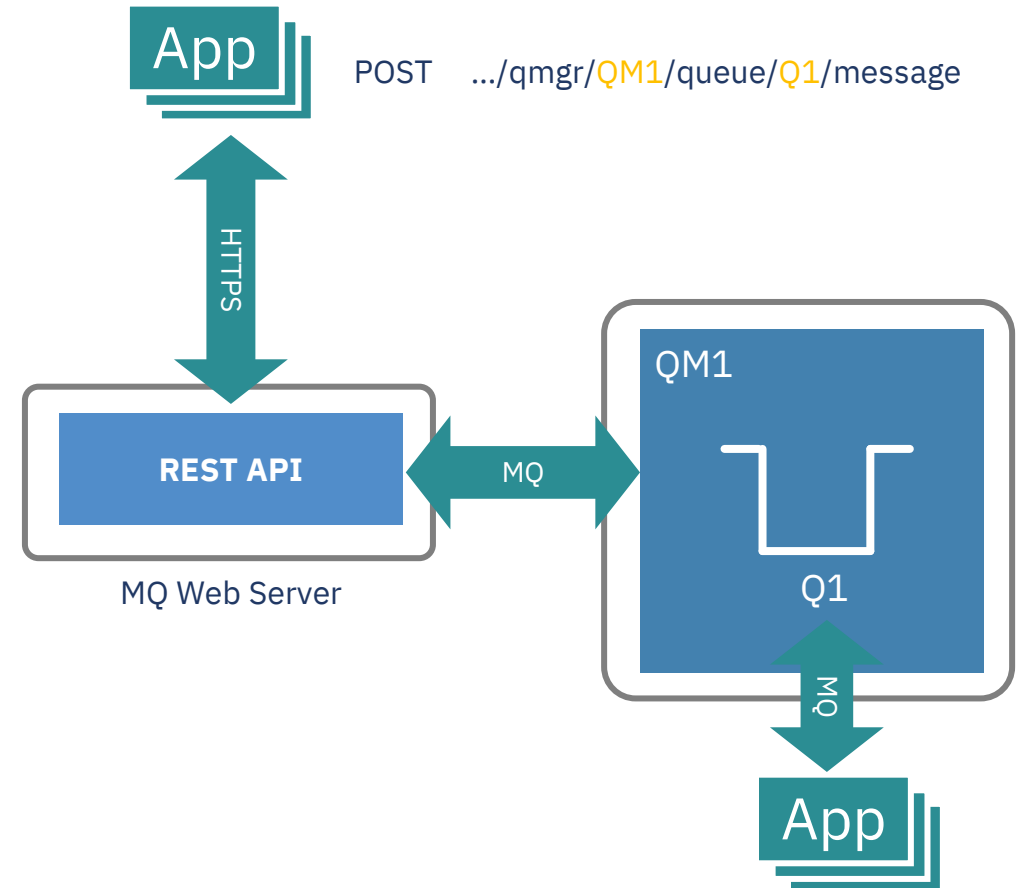

Update the MQ Console independently to queue managers.

Centralise administration for your MQ estate.

# REST Messaging: Remote queue manager support

- The REST Messaging API can now be used with remote queue managers, enabling you to interact with any queue manager in your estate, running at any version
- Previously, it could only be used with queue managers local to the MQ web server:
  - Same installation on distributed platforms
  - Same LPAR and at the same version as the MQ web server on z/OS

# IBM MQ | Pre-built MQ Advanced Containers

Wider platform support

For OpenShift users, IBM offers a pre-built MQ container image and an MQ Operator, while customers deploying MQ in other container environments need to build the image from a sample, which requires more effort and skills

From 9.4.1, IBM provides a pre-built MQ Advanced container image that can be deployed into container runtime environments provided by containerd, cri-o, Podman or Docker

## What does it mean?

Use the pre-built container image to deploy MQ instead of building an image from a sample

## What's supported?

IBM provides defect and usage support for the IBM MQ, IBM-supplied MQ container enablement code, but is not able to help users configure and debug problems with their container environment or deployment pipeline

## Where to download it from and what entitlement is required?

Download from [IBM Container Registry](#), for which the client needs to have either MQ Advanced or Cloud Pak for Integration entitlement

## Note:

- Whilst containers can run on any Linux OS, Red Hat provides [support](#) for Red Hat packages for containers running only on Red Hat Enterprise Linux or Red Hat Enterprise Linux CoreOS hosts
- [IBM Container licensing](#) policy is supported in Kubernetes based platforms only
- Interim fixes will be available for the pre-built container image and can be downloaded from IBM Container Registry

Run MQ anywhere  
you want!

**Container Infrastructure**  
Deploy and run in the cloud or on  
premises

**Orchestration**  
Automate deployment and  
management of containers

## MQ as a Service Reserved Instance

Single Tenant: Client SaaS queue managers will run in a dedicated IBM managed cluster, increasing security and reducing the chances of performance being impacted by other client workloads.

Multi-Zone high availability: Data replication across 3 availability zones protects against data loss in the event of a failure. Upgrades can also be performed on a rolling basis across availability zones, maintaining service during upgrades.

Private network endpoints:  
Provides a higher level of network control and an additional layer of network security so message traffic or endpoints are not exposed to the public internet.

Automated deployment:  
Automating the deployment of SaaS queue managers in a repeatable and programmatic way allows MQ as a Service to be used at scale, helping save on administration costs, reducing errors and deployment time.

# Other updates

- **Message expiration**  
First class CAPEXPY attribute to configure how long messages are kept on queues
- **Non-production entitlement**  
Reduce the cost of licenses in non-production environments and gain better visibility into the size and deployment of license distribution across your estate.
- **MacOS support**  
MacOS developers can now build and run an IBM MQ container image natively on Apple Silicon without the need for Rosetta emulation.
- **Managed File Transfer**  
Additional resource monitor logging events and updates to diagnostic capture.

- **Libraries and AIX support**  
MQ supports .NET 8 & .NET 6 libraries.  
  
Support for the XL C/C++ 17 compiler on AIX alongside the existing XL C/C++ 16 compiler.
- **MQ Classes support for JMS and Jakarta**  
Support for using modular applications with IBM MQ classes for JMS and IBM MQ classes for Jakarta Messaging.
- **Automated workload balancing for JMS**  
Uniform Clusters automatically balance JMS workloads, enabling users to build resilient, horizontally scalable messaging systems.
- **MacOS client installable via Homebrew**
- **MacOS client TLS provider (9.4.1)**  
ARM64 now the same as other platforms (kdb/p12 stores)

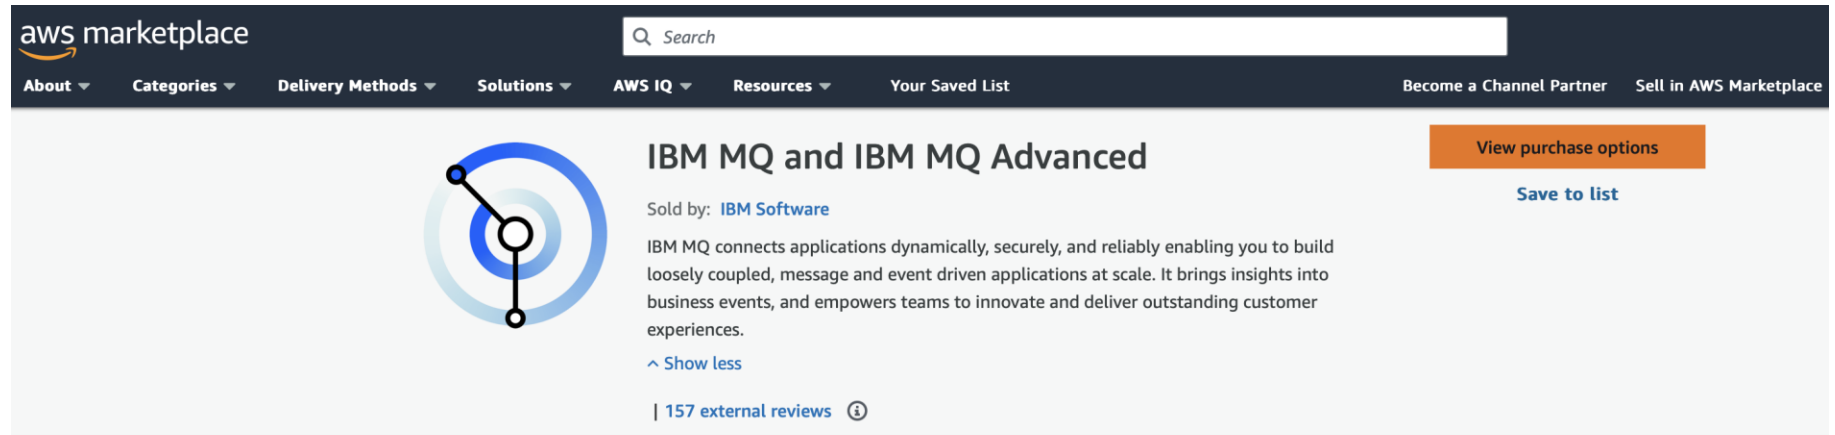

# Amazon Web Services (AWS)

# AWS Marketplace

Businesses with an AWS strategy can purchase either IBM MQ or IBM MQ Advanced SW licenses via the AWS Marketplace.

Explore now:

<https://aws.amazon.com/marketplace/pp/prodview-oo2o5363yebmo>

The screenshot shows the AWS Marketplace interface for the product "IBM MQ and IBM MQ Advanced". The header includes the AWS Marketplace logo, a search bar, and navigation links for About, Categories, Delivery Methods, Solutions, AWS IQ, Resources, and Your Saved List. On the right side of the header, there are links for "Become a Channel Partner" and "Sell in AWS Marketplace". The main content area features a circular icon representing the product, the product name "IBM MQ and IBM MQ Advanced", and the seller "IBM Software". A description states: "IBM MQ connects applications dynamically, securely, and reliably enabling you to build loosely coupled, message and event driven applications at scale. It brings insights into business events, and empowers teams to innovate and deliver outstanding customer experiences." Below the description is a "Show less" link and a note about "157 external reviews". On the right side of the product card, there are two buttons: "View purchase options" and "Save to list". At the bottom of the product card, there are tabs for "Overview", "Pricing", "Usage", "Support", and "Reviews", with "Overview" being the active tab.

## Product Overview

Thousands of enterprises around the world and across all industries trust IBM MQ with their applications and data. Its proven reliability, security, and support for diverse applications, from traditional on premise systems to cloud native apps, make it the future proof choice for connecting within your business and with your partners.

Key features:

**Connect anywhere:** Deploy IBM MQ where your applications and data reside, and rely on IBM MQ to connect systems together. Run it in containers, on OpenShift or Kubernetes, Virtual Machines, or on baremetal across a broad range of platforms in public cloud and on premises.

**Connect anything:** IBM MQ supports a range of modern and legacy languages, protocols and APIs so you can connect any application to any other, from COBOL to Spring Boot, node.js, Go and more!

**Multiple messaging patterns:** IBM MQ supports point to point messaging with Store & Forward and Request & Response patterns, as well as Publish and Subscribe with dynamic topics and subscriptions. This provides a simple, flexible, and structured way to build communication into software applications with exactly once message delivery, freeing up developers to focus on the business value of their code.

## Highlights

- IBM MQ is available in 2 editions to suit the needs of your business.
- IBM MQ is the standard offering providing the essential capabilities you need to securely and reliably connect applications, enable insights into events, and empower teams to innovate and deliver outstanding customer experiences.
- IBM MQ Advanced provides everything that is available in the standard offering plus additional capabilities providing state of the art data resiliency, broader connectivity options, and advanced security for end to end encryption and audit compliance. To upgrade from IBM MQ to IBM MQ Advanced, please contact us at [IBMMQonAWS@ibm.com](mailto:IBMMQonAWS@ibm.com)

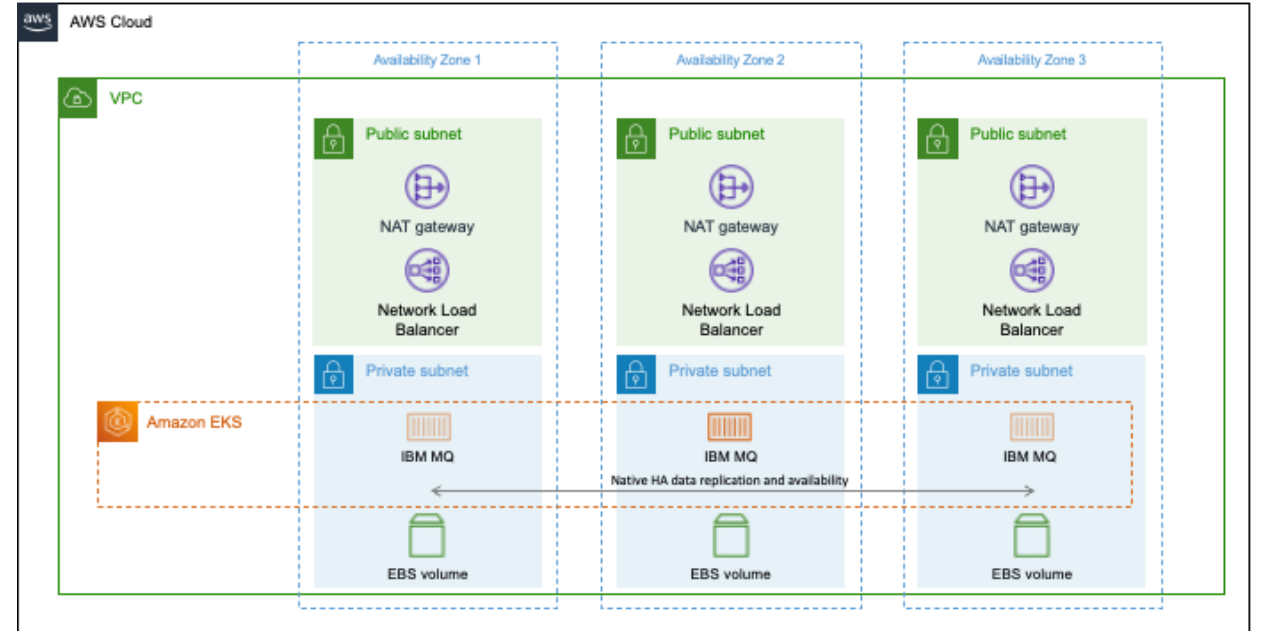

# AWS Partner Solution

The IBM MQ AWS Partner Solution is a best-practice deployment of an IBM MQ Native HA queue manager running on the AWS Elastic Kubernetes Service (EKS) platform.

Reduce hundreds of manual procedures to just a few steps to build and start a best-practice deployment of IBM MQ on AWS Elastic Kubernetes Service (EKS) within minutes.

To get started, visit:

[aws.amazon.com/solutions/partners/ibm-mq/](https://aws.amazon.com/solutions/partners/ibm-mq/)

## Rapid deployment

Deploy fully-functional MQ software on the AWS Cloud with a single click

## Proven topology

Benefit from container-ready, highly available reference architecture

## Resilient connectivity

Use the market leader for reliable, secure, scalable message distribution

# 64-bit Channel Initiator

Previously, server-connection channel messages were staged by the channel initiator in a set of buffers in 31-bit storage

Large messages would limit the maximum number of active channels

Now with 64-bit storage in the channel initiator, a larger number of channels can connect at the same time

Samples have been changed to have MEMLIMIT=2G

- 2GB of 64-bit storage by default

For 104 concurrent clients sending 10MB messages...

Memory footprint per client:

	9.3.0	9.3.x
31 bit	10.4MB	112KB
64 bit	0	11.6MB

Assuming 1.3GB free space below the bar, this implies a maximum of 128 clients at 9.3.0

At 9.3.1, we can get to 9999 clients (the maximum), assuming a suitable MEMLIMIT

# Flexible monitoring on z/OS

Enhanced SMF statistics for queues that extends initial support added in 9.3.

**DISPLAY QSTATUS** information is now available in the SMF record

The format of the queue statistics data record is described in assembler macro **thlqual.SCSQMACS(CSQDQQST)**

**Note:** Data captured regardless of the MONQ attribute on the queue

```
MV4A,MQ27,2022/06/24,11:27:29,VRM:931,  
Queue Name.....Q1  
Disposition.....Private  
Pageset ID.....4  
Bufferpoll ID.....0  
THIS IS A FULL RECORD  
Current Depth.....10  
Open Output Count...2  
Open Input Count....1  
QTIME Short.....5029503  
QTIME Long.....5029503  
Last Put Time.....DBB3F45BDA390805  
Last Get Time.....DBB3E8DCEC8C0114  
Oldest Message Age..64
```

UNCOM(YES|NO) data is also captured

# MQ Console | New for z/OS

# MQ available in IBM z/OS Cloud Broker

The screenshot shows the Red Hat OpenShift console interface. The left sidebar contains navigation options: Administrator, Home, Operators, OperatorHub, Installed Operators, Workloads, Networking, Storage, Builds, Pipelines, Observe, Compute, User Management, and Administration. The main content area is titled 'Installed Operators' for the project 'mayur-test'. It displays a table of installed operators with columns for Name, Managed Namespaces, Status, Last updated, and Provided APIs. The 'IBM z/OS Cloud Broker' operator is highlighted with a red box. Below the table, there is a text block and a list of features.

Name	Managed Namespaces	Status	Last updated	Provided APIs
 <b>DevWorkspace Operator</b> 0.22.0 provided by Devfile	All Namespaces	✔ Succeeded Up to date	🕒 13 Sept 2023, 17:44	DevWorkspace DevWorkspaceTemplate DevWorkspaceOperatorConfig
 <b>IBM Cloud Pak foundational services</b> 3.23.7 provided by IBM	All Namespaces	✔ Succeeded Up to date	🕒 13 Sept 2023, 17:46	CommonService
 <b>IBM Wazi for Dev Spaces</b> 3.0.0 provided by IBM	All Namespaces	✔ Succeeded Up to date	🕒 13 Sept 2023, 17:46	IBM Wazi for Dev Spaces IBM Wazi for Dev Spaces - License
 <b>IBM z/OS Cloud Broker</b> 2.2.3-d090f22 provided by IBM	 mayur-test	✔ Succeeded Up to date	🕒 26 Sept 2023, 15:03	Operator Collection SubOperator Config z/OS Endpoint z/OS Cloud Broker
 <b>IBM Z and Cloud Modernization Stack - MQ Resources Operator</b> 1.0.0 provided by IBM	 mayur-test	✔ Succeeded Up to date	🕒 28 Sept 2023, 19:48	Manage MQ Local Queues Manage MQ Alias Queues Manage MQ SvrConn Channels
 <b>Red Hat OpenShift Pipelines</b> 1.11.1 provided by Red Hat	All Namespaces	✔ Succeeded	🕒 13 Sept 2023, 17:43	-

Use Red Hat OpenShift to easily deploy resources to z/OS, in your hybrid cloud.  
Now including:

- Local and alias queues
- Server connection channels

[https://github.com/IBM/zos\\_mq\\_operator](https://github.com/IBM/zos_mq_operator)

# z/OS HyperWrite behaviour changes

- Previously, when a user set the value of ZHYWRITE(YES), the queue manager would check if it believes it has the capability of performing zHyperWrite's for log writes.
- However, a drawback was discovered in that the queue manager assessed its zHyperWrite capability at start-up despite the potential for this state to change while it is running.
- If the queue manager checked the zHyperWrite capability while this was temporarily unavailable, then it could result in a scenario in which zHyperWrite is not attempted until the queue manager is restarted.
- Now, irrespective of a log's perceived zHyperWrite capability, the queue manager will always attempt to utilise zHyperWrite if configured to do so (via ZHYWRITE(YES)).

# MQ Appliance 9.4 updates

# IBM MQ Appliance SSH Password and Certificate Authentication

SSH service enhanced to support standard password and certificate authentication

CA-signed certificates simplify automation and offer improved security over passwords

Revoke individual user certificates, if required

# IBM MQ Appliance Disaster Recovery between HA Groups

DR between two HA groups

Automatic fail over and synchronous replication within each HA group

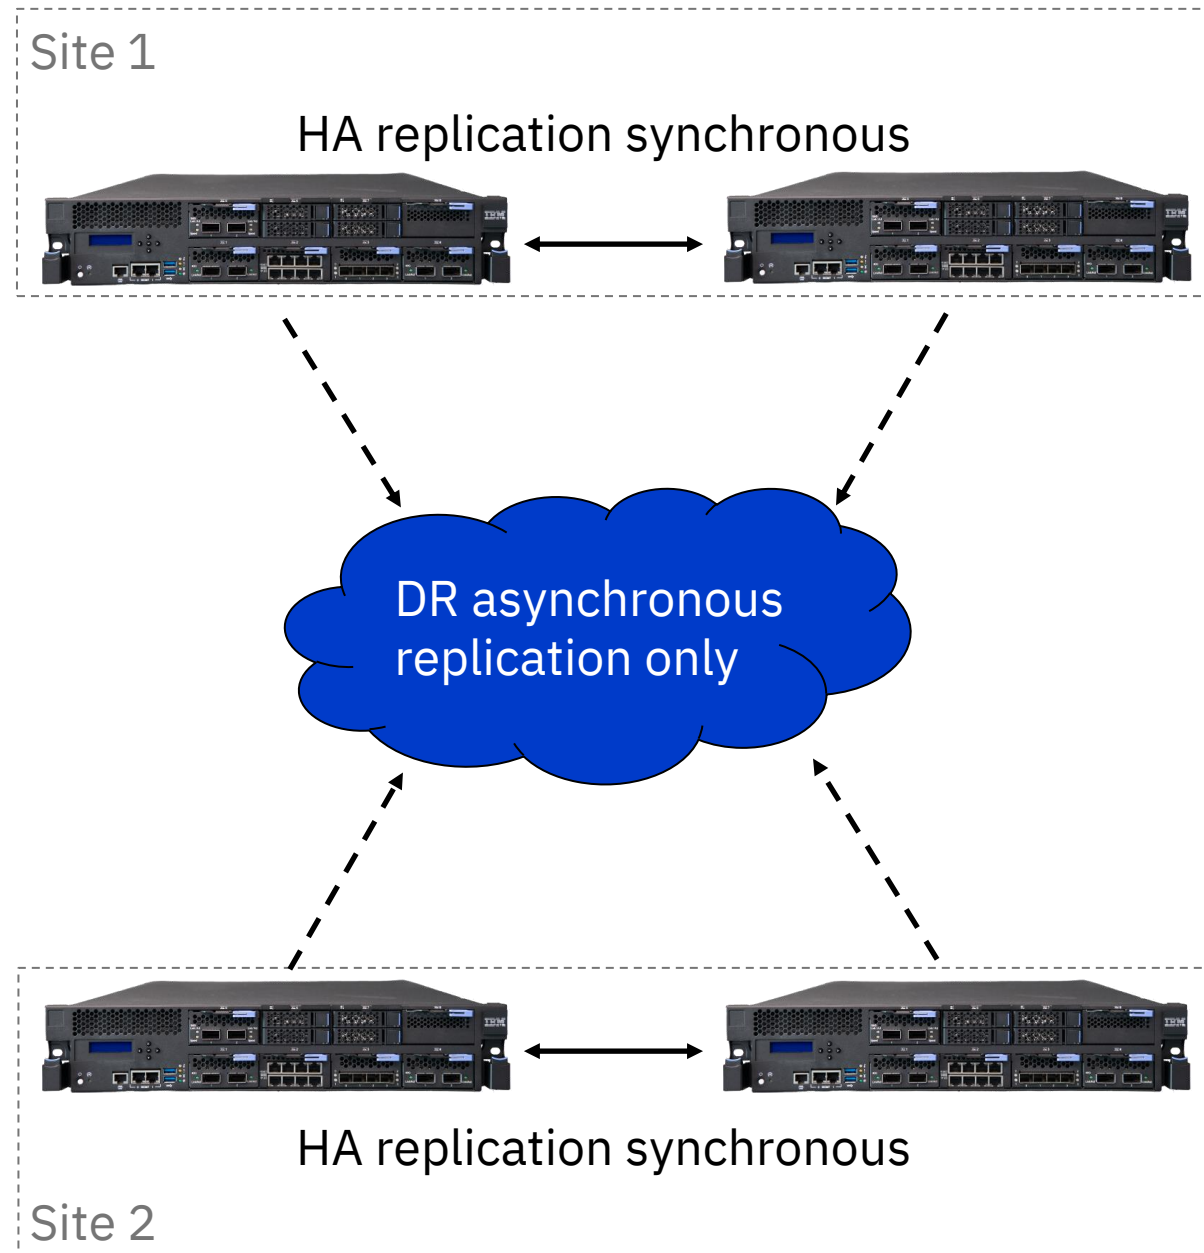

Manual fail over and asynchronous replication for DR between the HA groups

Both HA groups can have active queue managers

Some queue managers can be active at site 1 and others at site 2

If one site fails, then all queue managers can be active at the remaining site

Each HA group can have a floating IP address, but a floating IP cannot span the two sites

# IBM MQ Appliance File System Usage Monitor

Reports file system usage for queue manager and system file systems at a configurable interval

Avoids need for manual polling

Generates log events that can be consumed by logging targets, and optionally forwarded to central monitoring tools, such as Splunk or Elastic Stack

Generates informational, warning, or critical alerts based on configurable usage thresholds

- Set default thresholds for all file systems
- Set specific thresholds for individual file systems

Objects / Monitoring / Modify File System Usage Monitor ☆ Apply Cancel Undo ⓘ

```

# IBM MQ Appliance Secure Backup

Encrypted backup of system settings that can be restored on the same or a different appliance

Avoids need to backup individual resource definitions

Equivalent to the same capability that exists for the DataPower Gateway

Includes all system settings, local users and system certificates

Does not include queue manager configuration or data - queue managers are backed up and restored separately

Secure Backup

```
mqa(config)# secure-backup mybackupcert temporary:///myBackup
Secure backup to 'temporary:///myBackup' scheduled (may take a few minutes to complete).
Secure backup is complete.
